

Interval Historical Prices

The MPowerD supplemental insurance policy expands opportunity to have the highest possible price used to set a producer's trigger margin for 2018 corn and soybeans. Learn more by watching the tutorial video link in upper right corner of the MPowerD estimator at www.agentevantage.com.

Producers can manage their price risk by using any or all of the following:

- Lock in the current Market Price.
- Establish a guaranteed Additional Price Coverage to the Projected Price.
- Expand opportunity to achieve the highest possible Minimum Margin Trigger by choosing up to twelve alternative price discovery periods in full or half month intervals now through August 2018.

Sales Closing date to buy or adjust the MPowerD policy is October 16, 2017.

The graphs below for corn and soybeans give agents and producers perspective into which intervals have achieved the highest prices over the past 21 years. The graph to the left shows the years with large expected stocks-to-use ratios like we are predicted to have again for 2018. The graph to the right shows the number of times in the past 21 years any particular interval shown has been in the top five highest intervals for the year. The more intervals selected by the producer, the greater the probability one of the intervals they select will be the highest price for the interval choices remaining in the crop year.

Producers are averaging the purchase of 5 or more intervals. The average price per month of opportunity drops dramatically as the producers selects multiple intervals.
